

Workshop 1 Transcript: Riza x MSBC Group

Date: June 02

Duration: 66 minutes

Recording: [Watch Recording](#)

Attendees

- **Riza Kaya** – Founder/Client, Offline AI EdTech Visionary
 - **Suhail Ahmed** – AI & Technical Strategy Lead, MSBC Group
 - **Ajay Chakrobarty** – Business Analyst, MSBC Group
 - **Shakti Gohil** – Technical Consultant, MSBC Group
 - **Sahil Sharma** – Backend & AI Integrations, MSBC Group
-

Summary

This workshop focused deeply on **Use Case 1: AI-Driven School Inspection Readiness**. The discussion covered technical requirements, access management, deployment models, system outputs, and potential data integration methods. Stakeholder roles, document flow, output format expectations, hardware considerations, and phase planning were all mapped out with specificity. Several crossovers into Use Case 2 were identified and acknowledged for later workshops.

Key Discussion Points

1. Technical Document Planning

- Focus on developing two key deliverables:
 - **SRS (Software Requirements Specification)**: Functional and non-functional requirements
 - **Technical Design Document**: Infrastructure, platform, dependencies, hardware specs

2. Deployment Model

- **Primary focus**: Offline device with Linux-based system
- Multi-tenancy web-based model will be explored later
- Hardware modularity is critical: tiered specs for user concurrency (1–5, 5–20, etc.)

3. Stakeholder Access

- Primary users: School leadership and admin (approx. 5–8 people)
- All users see same data (no need for variable content access initially)
- Each user will have their **own profile & chat history** for personalized experience

4. Data & System Inputs

- Data sources:
 - KHDA/ADEC framework documents
 - Past inspection reports
 - MIS/LMS integrations for student data (attendance, grades, etc.)
- Schools will upload relevant documents to local folders
- Potential for SharePoint, OneDrive, or API integrations (on the roadmap)

5. System Outputs

- PDF reports: generated on demand, aligned with KHDA formatting
- Interactive chatbot to ask/follow-up queries on uploaded documents
- Visualization support (charts, graphs) for insights like subject performance, trends
- Suggestions and action items generated from inspection frameworks

6. System Features

- Predefined prompts and suggested actions (RAG-based analysis)
- History panel and simple chat-based UI (inspired by ChatGPT)
- File upload (PDF, image), data caching, vector-based search support
- Admin dashboard with role-based access, file control, and user tracking
- Onboarding wizard for folder setup and required data list

7. Hardware & Scalability

- Base specs for single-school usage
- Customizable storage and GPU power depending on usage/concurrency
- Possible tiered subscription models based on data volume and user count

Key Insights

- **AI as an Internal Advisory Tool:** The platform will not generate public-facing reports but rather provide data-driven internal recommendations.
- **School Variability:** Each school's system and curriculum is unique; onboarding requires mapping their data to standardized formats.
- **Chatbot + PDF Coexistence:** Users want conversational interaction *and* downloadable inspection readiness reports.
- **Hardware-Dependent AI Performance:** Speed and responsiveness depend on optimized local hardware, and this will affect licensing tiers.

Action Items

Owner	Task	Notes
MSBC Team	Draft & deliver SRS + Technical Design Document	Cover use case 1 fully; infrastructure, functional flows
Riza Kaya	Share sample internal documents used in school inspection prep	Excel/PDF/Word formats from 4–5 schools
MSBC (Ajay)	Coordinate with UI/UX team to begin interface design with Riza	Visualize chat + dashboard + admin views
MSBC Team	Analyze KHDA & ADEC handbooks	Define required data fields for inspection assessment
MSBC (Ajay/Suhail)	Propose hardware spec tiers & costing models	Link to user concurrency & GPU/RAM/storage needs
MSBC (Suhail)	Outline storage & caching strategy for offline data	Especially for vector stores and chat histories
Riza Kaya	Prepare scenarios & sample data for Use Case 2	To be reviewed in upcoming workshop
MSBC Team	Send agenda and questions to Riza before next session	Ensure structured workshop for use case 2

Transcript

Workshop 1: Riza x MSBC Group - June 02

[VIEW RECORDING - 66 mins \(No highlights\)](#)

[@0:00](#) - Ajay Chakrobarty

I said, I'm sorry. been that. I never know who to join from the room, right? Like audio is on page.

[@0:09](#) - **Suhail Ahmed (MSBC Group)**

Like my EPS is there and audio is on page. No risk.

[@0:17](#) - **Ajay Chakrobarty**

Why is she telling?

[@0:20](#) - **Suhail Ahmed (MSBC Group)**

No worries.

[@0:21](#) - **Ajay Chakrobarty**

What is this? If you want to camera, you will the whole face. Oh, that's Yeah. I don't want to shoot the top part of your head.

I am. man. Yeah, honestly, I would kill for that. Damn. You would kill for anything at this point.

[@0:55](#) - **Suhail Ahmed (MSBC Group)**

What you mean by that? What do you mean by that? No.

[@1:02](#) - **Sahil Sharma**

So it will be like Rook. I never explain myself. In meetings, typically there will be one noise from the back.

[@1:18](#) - **Suhail Ahmed (MSBC Group)**

Everyone who speaks. Doesn't matter if it's someone from the production floor there. Doesn't matter if it's me. Everyone who speaks.

One noise constant. At least Sahil can say something. Shani to bachara pachchaka is seh. He very stressed out. I think from everyone, Shani gets the most stressed.

For what Sahil says. So I'll continue saying. Okay, please let's see. Hey, Rilzha. Hi. Sorry, I was just reaching out.

[@1:56](#) - **Ajay Chakrobarty**

to get something. One second. Sorry. Oh. I'm

[@2:00](#) - **Riza Kaya (Unverified)**

Oh, sorry, my last meeting slightly overran. I feel like I've been in meetings all day now. Always. That happens.

Thank you, guys, and welcome, everyone. Thank you. How are you doing? Good?

[@2:16](#) - **Suhail Ahmed (MSBC Group)**

Good. Busy, busy, but good.

[@2:20](#) - **Riza Kaya (Unverified)**

All right. That's good.

[@2:21](#) - **Suhail Ahmed (MSBC Group)**

So purpose of this call is to dive into the first use case. We've reviewed the documents as well as the diagrams you've shared, and we're ready to have a technical dive into the first one to extract whatever information we need.

[@2:36](#) - **Riza Kaya (Unverified)**

Was that helpful, the use cases and some kind of just some? Yeah, good. It was. So the team's reviewed it.

[@2:45](#) - **Suhail Ahmed (MSBC Group)**

Everyone who's on this call has reviewed those diagrams and documents, and we understand the broader vision as well as what you have in mind in terms of strategy.

But what we'd like to do is narrow down into the specifics and ultimately provide an. All right, okay, so let's go straight into the questions.

Anyone would like to say anything before that? Ajay Chakrobarty, any questions before we jump into it?

[@3:16](#) - **Shakti Gohil**

Yeah, just only one thing to clarify to Riza, that since you requested in our last one that you want to focus on technical part, right?

And you also have some of the knowledge around it. So we think that it is not necessary to prepare any business requirement document because I think you are there, right?

You know what is required. Yes, yes, yes. So preparing the necessary, right?

[@3:41](#) - **Riza Kaya (Unverified)**

Any documentation that is not required.

[@3:43](#) - **Shakti Gohil**

Instead, we will put those efforts, right, made on the technical part, creating the, I would say, specification document, technical design that will help you to see, okay, down the line, what are the phase one, phase two, phase three look like, right?

Yeah, we have go-to-market strategy.

[@4:02](#) - **Riza Kaya (Unverified)**

We have the business plan ready. We have data testing ready. All of that business use case, a lot of that work has been done and there is, you know, we've identified in the market there is a requirement for it.

It's mainly, you know, go-to-market, technical part, how are going to do it? How are going to maintain this?

[@4:21](#) - **Shakti Gohil**

Okay, then I think, do you think that putting those features, functionality into a document is necessary? Because if go-to, yeah, so for this project, yeah, so when we refer SRS, right, system specification, that means when you look at that document, you get about, these are the functional requirements, screens, some visuals, right, how you can capture the detail, the validations, what is expected output, workflow, right, you will have all those will go-to-market.

In the specification document. So I think that is required, right, as a part of the process?

[@5:07](#) - **Riza Kaya (Unverified)**

Yes, yes. Because basically we're trying to create a blueprint, right? Correct. So when you, let's say, have two or three members who are ready to start development, then they have something to go with it.

[@5:19](#) - **Shakti Gohil**

This is the guide. This is what we're trying to build. This is what I expected, right?

[@5:24](#) - **Riza Kaya (Unverified)**

Okay, right. Yes, this is the operating system. sits on, this is what this is on, and then this is the flow.

[@5:31](#) - **Shakti Gohil**

And with functional requirement, we will also cover the technical, exactly what you mentioned, to run this software, what do we need?

What are the main dependencies? Do we need only Windows or it can run on Linux, right? What platform, what are the different services we expect?

Database, okay, are we using MySQL or PostgreSQL, or are we using AWS RTS, whatever it is, right? So we will have those technical designs.

And then I think this is also pretty much a ready guide that any developers need if necessary tools and library.

Okay, so Suhail and Ajay, I think we are focusing only on SRS and the technical design, right? I think that's pretty much, I think, two documents normally we need as a development team to start with.

And yes, we also need to talk about the infrastructure that this is developed, right? What do we need? Do you have any specific preference, Riza, on the hardware, whether AWS, Azure, Google?

[@6:40](#) - **Riza Kaya (Unverified)**

Oh no, but we've got two, we've looked at the multi-tenancy cloud offering, and also a box or a server that sits with the client.

So that's the offline device, right? Offline device, yeah. Yeah, so there's two different tech, but if we don't have the time, I would rather focus on...

It's on the offline, in-device technical spec, know, Linux, and then, you know, we wouldn't want to pay for any licensing, of course.

And then on the multi-tenancy web offering, the subscription model, again, I would look at you to give me a recommendation.

What would be the most efficient thing? So it's pretty, I think, high level.

[@7:28](#) - **Shakti Gohil**

This is for everyone. Mainly Shohan and Ajay, that on the server side, when we look at admin, where I should be able to create school one, school two, school three, when I onboard in school.

And yes, as a admin, I should be able to manage some of the access information, but pretty much I think school will have access as well.

So we normally refer as a client admin, right? Yes.

[@7:57](#) - **Riza Kaya (Unverified)**

Yes.

[@7:57](#) - **Shakti Gohil**

Where they can go, log in, and see that, okay. I am giving this application access to this number of staff members, this number of students, what they are doing, right?

[@8:07](#) - **Riza Kaya (Unverified)**

So we need to focus on those areas.

[@8:09](#) - **Shakti Gohil**

And then I think the second part will come is the offline device, how that will sync from the server, because we need some of the data on the server.

So that's the mechanism I think we need to keep in mind. Yeah. So this is the core part we are focusing on.

So the offline device, just need to work out how we're updating that device.

[@8:32](#) - **Riza Kaya (Unverified)**

Is it through a file for an email? Is it a file that we need to be physically there? Because ideally they might decide that they don't want any connections to the outside world.

Yeah, possible.

[@8:44](#) - **Shakti Gohil**

And okay, we have done work where if you are deploying any application offline, then we have a local server.

Local server means that server application is connected to the cloud. And that's the same. Application also connecting to your local device as well.

And it's not real-time or live connection, right, that works on the specific schedule or that works on a specific event that when we push from the server side.

So if that mechanism is okay, we will go with that. Or, you know, I think we need something where it updates from the cloud rather than it relies on the local file where I need to take a data, go to each school and update, right, if you want to make sure that they are working with latest logic.

Let us data, right, from the server. Yeah.

[@9:33](#) - **Riza Kaya (Unverified)**

To make it, I would say, more dependent. Yeah. It's the hardware as well. mean, yeah. How are we dealing with that load of the AI processing?

You know, are we using a graphics card or have we got a device that dissects it or, you know, that and then how does it sit on the school's network?

Yeah. Yeah. And it will give you something, right, where you're able to connect to the device.

[@9:59](#) - **Shakti Gohil**

And you're to see what is going on, right? it's a secure connection, yes. Correct, correct, yes, right, yeah, yeah, fine, okay, so that will be part of the technical solution, okay, and just wanted to make sure that we are aligned on the expectation that what exactly we are focusing and what you are getting at the end-to-end.

[@10:17](#) - **Riza Kaya (Unverified)**

I think the main focus, if we don't have time, not to look at the multi-tenancy web, private web offering, but focus on the single box or a server, you know, that can scale up depending on processing power, amount of data on there, so offline devices, the kind of main.

[@10:35](#) - **Shakti Gohil**

So what I have done, what I have done in this situation in the past, just for your information, that we design a solution focusing one school, one offline device, with a single mechanism, right, and now if you want to, right, scale this solution, then we look at what is the best way, rather than going into a technical part, developing that as a.

But can we just extend this solution to 20 school? What do we do? What do we need? Do we need just a USB stick, cloned, bam bam, or cloned through the clinics?

the line, can, I would say, enhance and improve what has been basically designed and developed. We just keep and try, would say, minimum effort at the initial stage, where possible.

[@11:24](#) - **Riza Kaya (Unverified)**

All right, fine. Okay, thank you.

[@11:25](#) - **Ajay Chakrobarty**

And just one confirmation, we will cover all the four use cases in the single document and then pick it up from there as per the requirement or as per the priorities, correct?

Correct, correct. Yeah. Yeah. Okay.

[@11:41](#) - **Shakti Gohil**

Suhail, do you have any question? We are clear, right? Yeah, we're clear. Okay, good. Fine. So I think, Suhail and Ajay, you can continue.

I will be on this call for next, I would say, 20 minutes or so. And then I have another call, then I may jump on, right?

But you guys can- We might put you to sleep with the technical details, so.

[@12:03](#) - **Riza Kaya (Unverified)**

Okay, no worries.

[@12:05](#) - **Shakti Gohil**

That's fine.

[@12:07](#) - **Suhail Ahmed (MSBC Group)**

All right. Thank you. Thank you, Riza. Thank you.

[@12:09](#) - **Shakti Gohil**

you.

[@12:09](#) - **Riza Kaya (Unverified)**

Steve, you can start. All right. So yeah, let's get right into it.

[@12:14](#) - **Suhail Ahmed (MSBC Group)**

The first use case was AI-driven inspection, and I think just to sort of guide this conversation in the most conducive manner, let's discuss who the main stakeholders would be.

We know that it's currently school staff, but within them, who do you anticipate to have access and what sort of access, what should be the data points that they view and edit access to, is what we'd like to know.

[@12:40](#) - **Riza Kaya (Unverified)**

So on the school side, it'd be mainly the school leadership and then the administration team. I don't, depending on the size of the school, I don't see a huge amount of access at this point because it's very, unless, you know, there are certain teachers you need to get involved, but I don't see more than.

We five to eight members of staff accessing this, and I mean, they would have the same access as everyone else.

mean, what they're trying to aim is get a good score, right? It's a good score from their inspection. So if the senior leadership team appoints someone below them, you know, they should be able to access everything that the senior leadership is doing, because basically they'll be doing their work on their behalf.

Okay, understood.

[@13:34](#) - **Suhail Ahmed (MSBC Group)**

And how variable would the content be depending on who is accessing it? Will everybody be looking at the same things?

[@13:42](#) - **Riza Kaya (Unverified)**

Good question. Didn't think that far ahead. That's okay.

[@13:48](#) - **Suhail Ahmed (MSBC Group)**

Yeah.

[@13:50](#) - **Riza Kaya (Unverified)**

I mean, initially, I don't see a problem of seeing everything that the senior leadership sees. I mean, there's nothing secret there.

It's... All public documents. So the school inspection document itself is public on their website. The framework is public unless they have internal documents that they're going to be using to support their self.

Of course, they will upload the academic performance data and all of this information, but I don't see any separation between a student and a teacher.

Understood. That would be a separate content. But their staff, you know, they're trying to achieve the same goal. Right.

[@14:35](#) - **Suhail Ahmed (MSBC Group)**

And just when you said that publicly available school inspection report, you are referring to an authorities report, right, similar to KHTA?

Or are you referring to the report that this tool will generate, which will be published on the school's website?

[@14:50](#) - **Riza Kaya (Unverified)**

So any stuff at the moment that's produced from the system should not, you know, that would need to be reviewed in the school.

I don't don't Really for publishing because the KHDA report or the ADDIC report that comes in, it's signed and verified by the organization who provides that inspection.

It's not a school-generated report. The school-generated report is for internal use. That's for them to see where the negatives are, where do we improve, what's going on, how can we do this better.

It's more of an internal tool, not a public tool.

[@15:27](#) - **Suhail Ahmed (MSBC Group)**

And I'm just going to double back a bit over here to the first question I asked regarding the variability of content.

The reason I asked the question is because, well, I'm in Dubai and you'll have a better idea regarding the wider Western market, but in KHDA, at least, they have different metrics and different data points depending on the subject they are evaluating.

For example, computer science will have a set of metrics that mathematics would not share. So in such a scenario, we would require targeted assessment to provide a holistic score.

In such a case, would you want to perhaps extend access to HODs of relevant departments so they know where exactly they are lacking, or do you want to still keep it to the senior leadership team and keep an overall high-level score, which they can expand and get further granularity?

[@16:17](#) - **Riza Kaya (Unverified)**

I think just for simplicity, we should just keep it as it is, and if there's any improvements or any weaknesses, they should communicate that internally as a school and work towards it and use that document which the system spits out for that purpose.

[@16:35](#) - **Suhail Ahmed (MSBC Group)**

But while we're assessing, are we still considering each individual data point for every subject, or are we considering the more holistic general data points for the school?

So it'd be the framework of whatever ADEC and KHDA is providing.

[@16:51](#) - **Riza Kaya (Unverified)**

Okay, sure. Yeah, that's the framework they need to work towards.

[@16:55](#) - **Suhail Ahmed (MSBC Group)**

Right, and a framework including individual subjects and curriculum. Right. Yeah. Because the framework perhaps for CBSC could be different than.

[@17:03](#) - **Riza Kaya (Unverified)**

Yeah, exactly. How are they measuring? For example, Arabic and Islamic studies are always weak. Right. In schools. And, you know, that's kind of where they're focusing on.

And. Yeah, that's. So the framework normally has how they're measuring that in there. I mean, what we could do after this, I can send you an ad deck.

I mean, you could download it yourself. It's all available on website. Yeah. And then in that in that framework, it's a handbook of exactly what you need to do to get a good score.

Basically, that document through the RAG system should identify what are of it and then match it against what the school is doing.

Okay.

[@17:47](#) - **Suhail Ahmed (MSBC Group)**

So I'm going to save the actual content phase of what we'll be doing later on. But as for now, think the first phase was identifying the different stakeholders and the.

[@18:00](#) - **Riza Kaya (Unverified)**

nature of variability.

[@18:01](#) - **Suhail Ahmed (MSBC Group)**

Ajay and Sahil, are we clear on that or any questions from your end? Yep, no questions.

[@18:07](#) - **Riza Kaya (Unverified)**

I mean, what we could do maybe later is, again, we're in talks with the education board of these two, Abu Dhabi and Dubai, but that's kind of later.

It's not initially now, but later. They would need to have access. So basically, they load the framework and the schools access it directly from their systems.

what we're trying to get, that's finally where we would want to be, but not now because nothing is concrete at them.

We can't design something. We can't. We haven't got a concrete yes to. No problem.

[@18:44](#) - **Suhail Ahmed (MSBC Group)**

So ultimately you want a top-down mandate? Yes.

[@18:48](#) - **Riza Kaya (Unverified)**

Okay. So this is what you need to do. This is what we're doing. This is what we've done. So the previous school's outcomes and the reports.

So if you go to any of these schools, you their website. So Their KHDA or their EDEC reports will be on their website and what they've got, what scores they've got, and where their weaknesses and improvements.

So it's the combination of what's needed, what did you do last year or the last few years, what can you do, and what are the improvements you can do, what are the action plans, what's basically, how do you get an outstanding score?

Where are you, and that could be the combination of the KHDA framework and the guides, their previous reports, and any other information they may feel is relevant for that school.

Like, could be the curriculum, could be what they're doing, the digital citizenship, are they teaching about UAE and the culture?

Sure, okay.

[@19:50](#) - **Ajay Chakrobarty**

Just, just one question on that, like, as a leadership, leadership team, I could upload some of the documents on the interface along with.

Can I mention something in the interface so that the system could evaluate the data, like evaluate the data more with more clarity or maybe the system could evaluate the data or narrow down the information or it just that I could only upload the document and then system do this and needful.

[@20:22](#) - **Riza Kaya (Unverified)**

Not only do you need to communicate with the system, know, what in maths, for example, I sent you the list of potential prompts as well in the email.

Yes.

[@20:36](#) - **Sahil Sharma**

So we've come up with our advisors, some potential prompts.

[@20:40](#) - **Riza Kaya (Unverified)**

I think that kind of is a nice way to see what we're trying to get at. And in these prompts, some of the prompts may be, you know, show the correlation between maths and Arabic.

Why are we doing this? Right. What is the whole school we need to do? What UAE or Islamic studies are we weak at?

[@20:58](#) - **Ajay Chakrobarty**

know, and that could look at...

[@21:00](#) - **Riza Kaya (Unverified)**

That that could look at the framework, that could look at the previous past reports. Yeah, go ahead, Sahil.

[@21:08](#) - **Sahil Sharma**

Also, how often do these frameworks change? Are these frameworks like updating over time? And for different boards, there'll be different frameworks, right?

So we'll have to keep track of those as well.

[@21:19](#) - **Riza Kaya (Unverified)**

I think if we, so at the moment, it's yearly, but that's changing to, they're going to be changing it to free yearly.

And normally, it's a push from the government to the schools, so there's no communication back. So it's one-way push.

So whatever document it may be, the system should be able to deal with it. You just upload it, and they say, this is the framework.

And whatever it may be every year, some slight changes, some big changes. So we don't know the frequency. But at the moment, KHDA are looking at every three years, because this year, there's no inspection.

Okay.

[@22:00](#) - **Suhail Ahmed (MSBC Group)**

And this ties back into Ajay's previous question as well. So, sure, we'll schedule in mandatory maintenance for every school we deploy to every framework changes.

But apart from that, should the system flag gaps in required documentation? For example, in the school's file system or the intranet, they've uploaded their knowledge base, but perhaps for some of these reports, such as what is the correlation between Arabic and Islamic studies, the data simply isn't available.

So, shouldn't the system do a preliminary offline check, maybe midnight, every midnight, just to make sure the data still exists, it's still available?

And if it isn't, raise an alert on maybe a dashboard or send an automated email out to everyone who has access to the platform saying that these are the different data points missing, and the lack of these data points will lead to a lack of this information.

Yes, I think That would be a nice plus to have.

[@23:03](#) - **Ajay Chakrobarty**

And one more thing, like, let's suppose I have uploaded the document, I have given some of the additional information, and system do the needful and generate the output.

Now, can I ask the system related to the output, regarding the output, let's suppose, system is showing some of the information, which could be enabled or which could be...

which could be mentioned or which could be targeted as the mandatory things. So can I ask the system, and then system will highlight that information, or no, like system only generate the output and that's it?

[@23:46](#) - **Riza Kaya (Unverified)**

No, it should determine your weaknesses in each subject, in each area. So it should be a communicative, just like cloud or chat GBT.

You can ask the system. Questions. It should answer that specific question for you. Related to that generated output, generated output, but it may not have a generated output.

You know, that generated output is just for them to organize themselves offline.

[@24:15](#) - **Ajay Chakrobarty**

Yeah, so Ajay, we'll be preparing the report and maybe on demand, there'll be a chatbot, right, which could spec specific data points.

[@24:23](#) - **Suhail Ahmed (MSBC Group)**

However, when we get the response, the chatbot should still have the ability to answer follow up questions. Based on a response.

[@24:31](#) - **Riza Kaya (Unverified)**

It should remember the last conversation and keep a track of that, yeah. So we can chain that together. That's not an issue.

[@24:39](#) - **Suhail Ahmed (MSBC Group)**

All right. And so what we'll do is, after reviewing the handbook as well, a little more in detail, we'll come up.

We'll first see if there's what the differences are between the framework and KHTA and ADECC, considering those two as our preliminary targets.

And based on that, perhaps you might want. We also had a recommendation system, maybe a one-time onboarding wizard, which says, these are the different data points our system can generate for each of these data points.

You need to organize files in this folder structure or whatever means of integration we choose. So if a school simply doesn't care about the correlation maybe between economics and marketing, they don't need to upload the data.

But this way at least they're aware of what they're getting.

[@25:27](#) - **Riza Kaya (Unverified)**

Yeah, think just thinking of the offline device, know, just the folder structure within the device, you drop in what is relevant to you.

If you're in Abu Dhabi, there you go. This is where you drop in everything. If you're in Dubai, this is where if you're in Sharjah, you do this, you do this.

So it shouldn't be restricted for us to play around for each school. If they want to connect it to their SharePoint, their OneDrive or Google Drive, whatever it may be, that's something else we should be available.

But that's... Okay, sure.

[@26:02](#) - **Suhail Ahmed (MSBC Group)**

And are you planning on offering any means of data backup with an on-site device? Risks are high.

[@26:12](#) - **Riza Kaya (Unverified)**

Yes, but I think that again will be passed back to the school, the IT team. We're an AI company to help you get through and make it secure.

Now, this is an offline device. We need to work out how that is in the internal system, whitelisted and blocked.

And we need to work with the schools because every infrastructure is different in every school. Right.

[@26:39](#) - **Suhail Ahmed (MSBC Group)**

Okay. Yeah, just one question here on whether it's a SharePoint or a OneDrive integration.

[@26:46](#) - **Shakti Gohil**

So you did mention, Riza, that you're considering this as an out-of-scope. Right. So out-of-scope means now or we will tell school that this is something we're not going to do right in the near future or...

... ... We're not going to consider these, right? Well, it should be possible.

[@27:05](#) - **Riza Kaya (Unverified)**

We can do it. Yeah. But part of our offering in the first time we give them, we would ask them to say, look, the best thing to do is to take these off and stick them in this folder of what's necessary for you.

And only in this folder, in this offline device, is where it's accessed. Now, we should offer that API integration, but, you know, it's not the standard we would push.

Fine. Okay.

[@27:28](#) - **Shakti Gohil**

So maybe it is good to consider, right? Yeah, we can have it, Yeah. And when we look at the, right, roadmap, then we consider that version 1, these are the 10 items we are focusing.

And maybe down the line version 2, version 3, nice to have this, something still will come. But if you're discussing as a solution, right, we should have, you know, discussion that how, right, that can be achieved.

Oh, sorry, guys, it's not possible at all. And... And... Yeah, We don't have any option at this stage, but still put it to our backlog to explore at some stage.

So good to have those points covered. Not necessarily we have a solution at this stage. Yeah, I think we don't need to have a selling solution at the moment, but we should be able to do it.

[@28:21](#) - **Riza Kaya (Unverified)**

Basically, where the source of that PDF or that document or that Excel is coming from, I mean, it's not really, it's just telling the system, maybe, it's something we charge a little bit extra as a custom bit of work for them.

But that's, yeah, that's what I would say.

[@28:37](#) - **Shakti Gohil**

Normally what happens is when we go and sell, then this type of item comes as a question. And if you have an answer, then it's good.

And if you don't have an answer, then it's just delaying the conversation with the school, right?

[@28:51](#) - **Riza Kaya (Unverified)**

Yeah, yeah, yeah. We can do it, but that's kind of a custom development for them. Not custom, but it's a little bit more manual work.

Yeah, because... You know, we can't automate that because every single login is different. Are they on site? Are they on the web?

What is the link? So there needs to be some involvement from our side. They won't be able to do that themselves.

Yeah.

[@29:13](#) - **Shakti Gohil**

So maybe we can discuss the solution with later.

[@29:17](#) - **Riza Kaya (Unverified)**

Right.

[@29:17](#) - **Shakti Gohil**

But nowadays, those integration are very simple and straightforward. Yeah. We consider it as an admin or we consider a school login as an admin.

So they can set that up from their side with client app, secret ID, right, and the tenant ID. So that can be easily checked, whether it's email, we want to use their tenant, if it is a document, if it is a SharePoint, so that can be done very, very easily.

[@29:47](#) - **Riza Kaya (Unverified)**

And they don't need us, right, to enable that integration.

[@29:51](#) - **Shakti Gohil**

Normally, how you see, right, let's say, yes, I want to do integration, you just enable, you follow three, four.

Put a box, provide necessary configuration, validate the connection, and then it will start flowing.

[@30:06](#) - **Riza Kaya (Unverified)**

But yeah, I think we could leave that on the roadmap. Yeah, perfectly fine.

[@30:12](#) - **Shakti Gohil**

Yeah, one question here.

[@30:16](#) - **Sahil Sharma**

So as we are looking at the documents that we'll be uploading, so as we are uploading the curriculum as well, so we need something we can verify it against, right?

So we need the students' reports. We need the students' whatever activities they are doing. We need them as well as a verification system.

And there comes the bias. Like, you can handpick students. You can handpick report cards. That will be, you know, like you'll be stabbing.

You'll be losing there, right? So we need some unbiased system that will prevent you to do that. So that is also one thing I think we need to account for.

Because you are personally uploading. So there needs to be some unbiased system there.

[@31:06](#) - **Riza Kaya (Unverified)**

So in phase, what was the phase? So for phase two anyway, we will need this. I think phase one and two are going to be cross-referenced in the same RAC system anyhow, right?

Yeah. We need, again, part of the phase two before we move on, we would need a way of getting this data from the school management systems.

So the previous report, the subjects, the previous reports, the attendance data, the well-being data, the psychological data, whatever it may be, all that system lies within the school management system.

Now, we can't bring all the school management system because it's huge. There's thousands of tables. Now, what I try to do is build an interim database and then bring in that data from the school management system.

academies corporation management can't bring Now, that becomes difficult because every school uses a different school management system. Some of them are SQL databases and the way it's organized is different.

And you've got PowerSchool, which is a text-based flat file system database, which kind of the references exist twice. It's a horrible system.

It's how do we plug into their school management system. I mean, I've got contacts to them and we can plug into their school management system, maybe have a sync once a night so it's not a live connection, and we just pull in information that we need only.

Attendance, school ID, student name, attendance for the last whatever reason, thing, grades, report cards, and everything else that comes with it.

So these metrics are predefined, right? Yes, it's fixed. mean, attendance is attendance and the test scores are their test scores.

And the grades for each subject is there, and then there'll be text attached to it as well in some of the subjects.

[@33:08](#) - **Suhail Ahmed (MSBC Group)**

So Sahil, there will likely be a one-time setup for every new school onboarded at the start. They'll define these sort of different rules and decoals.

[@33:18](#) - **Riza Kaya (Unverified)**

Which MIS system they're using and what API. And then, you know, once we have all of it, we can have, I can set up all the API integrations with the major school management systems.

That's easy to do. We just got to pay them a yearly cost to have access to the APIs and the basic API, because they have different levels of access.

We don't need to write back to the database for them. Unless it's a school request, again, at the moment, it could be something in phase two.

I mean, in the roadmap, that we could write these outcomes and these recommendations back to the school management system.

But at the moment, we just want to pull that information, the basic data. Yeah.

[@33:59](#) - **Suhail Ahmed (MSBC Group)**

Makes sense. So another thing while we're on the topic of data is that the generation of these reports, are they going to be on demand or are they going to be periodic every quarter, every month?

[@34:11](#) - **Riza Kaya (Unverified)**

I think we could do on demand for now, just keep it simple so there's a human request for it.

Okay. Yeah, I don't think we need to do, because we don't know what are the timelines for, like for example, ADEC have frozen inspections for three years.

They don't need to be seeing regular updates on this. Okay.

[@34:34](#) - **Suhail Ahmed (MSBC Group)**

The reason I ask is purely because, well, firstly, you can plan out your hardware accordingly. And the biggest problem would be that there will be a wait, because we're running everything locally.

While we will accelerate this massively, no school is likely going to have computer infrastructure as sophisticated as some of these foundational model providers, which means there will be a noticeable,

So just so you know, we will provide the hardware.

[@35:06](#) - **Riza Kaya (Unverified)**

We're not going to rely on their hardware. Okay. We will optimize. Again, that's why I said how fast is the AI, how many tokens are going through, what time is needed, what is the speed, how many concurrent.

This is part of the spec we need is the hardware, you know. Okay. So what, and then we would have this hardware in different, so if it's five to ten users, then we can probably have like a small box we can give them.

If it's 20 to 50 users, then we would have a mid-sized server. If it's a whole school using it, you might need a few service racks to service the school and if they're going to be using it in the classrooms.

Okay. Understood.

[@35:49](#) - **Suhail Ahmed (MSBC Group)**

Now I think the main question is, what are the individual data points that we want to display in each of these management reports?

Do you have that detail somewhere already? Is that? Or is that something?

[@36:01](#) - **Riza Kaya (Unverified)**

I think that's something would be, it would be very similar to the school's report that they get from the inspection, from the inspections government, from basically ADEC.

Okay, understood.

[@36:19](#) - **Suhail Ahmed (MSBC Group)**

So what we'll do is we'll pull a report from ADEC, or let's just say ADEC, and along with that we'll add a couple sections, which would be what stage you are at currently, what would be required to get to the next stage, if there was a next stage, your biggest strengths, your biggest weaknesses, and do you fancy some charts, graphs?

Yes. What kind of charts are we talking about?

[@36:48](#) - **Riza Kaya (Unverified)**

Attendance, mapping against attendance. I can get you a list of these measurements, you know, these, again, that goes over to the phase use case too.

So there's a lot of, a bit of crossover from the data. The only thing that differentiates it is the audience, what they're accessing.

And the way you present the data as well. Yeah. So they should be able to basically use it like Cloud or ChatGBT, you know, here's a list of 20 students, who are my top performance, list it for me and make the top one green, put it on a pie chart, put it on a gantry, you know, these kind of things should be possible.

So, again, we're trying to replace the Power BI capabilities because we have those data points that the Power BI is using anyhow.

We're just kind of using the AI to use it. And just, it's not addict. If you can do K-H-D-A.

Sure. No problem. The Dubai one, because that's what we're focusing on. We can do K-H-D-A. K-H-D-A is the one that you need.

[@37:54](#) - **Suhail Ahmed (MSBC Group)**

So you're envisaging like a report, PDF report layout and maybe to the side of it. Click on it, it will collapse, and you will see a chatbot which is capable of producing charts and referencing particular sections from the said PDF report.

[@38:11](#) - **Riza Kaya (Unverified)**

For a simple interface, a chat interface just like Cloud, the users can ask at that moment, produce me a PDF of what the inspection is and how it can be better, and then they can download it.

And in the same window, they can ask, can you show me a graph of our weakest subjects or, you know, some of these prompts that they can do it all within the same user interface.

Okay.

[@38:40](#) - **Ajay Chakrobarty**

So, as a user, can I ask the system for the regenerate if the system is not able to produce as per my expectation?

[@38:51](#) - **Riza Kaya (Unverified)**

Yeah, it should just work like ChatGBT. Oh, can you just look at this and put it this way, please, and you should do that.

[@38:59](#) - **Ajay Chakrobarty**

Yes. Thank you. you. What would be the format of the output? Or is it like, until and unless I haven't mentioned as a user, okay, generate this as a PDF, the system will focus only in a view format.

And once I have mentioned that, then only it will provide a particular format. could be PDF or something else.

The user should ask for it, yes.

[@39:23](#) - **Riza Kaya (Unverified)**

Or we could have easy, predefined, mostly used prompts. And then they could just click on that.

[@39:31](#) - **Ajay Chakrobarty**

Mostly used prompts. And one more thing, like, is there any specific section or sections which needs to be, like, most important thing while generate any output or every section will have the same importance?

[@39:54](#) - **Riza Kaya (Unverified)**

I think it would be the weaknesses that they have in the previous report. Would be their kind of priority because that's what they need to fix to get better.

How you would do that, I don't know how you would. Yes, we can change the sequence.

[@40:13](#) - **Ajay Chakrobarty**

If we have any predefined format, then we can change the sequence to focus the weakness at the very first.

So in the reports you'll see, in the school reports, what KHDA gave that school.

[@40:26](#) - **Riza Kaya (Unverified)**

And then a text to say, this is what you need to do to improve this. Satisfactory, you know, the system go, all satisfactory, bring them to me, let me see.

All not doing well, bring them to me, you know, just dissecting that report. Yeah, also there should be some sort of dashboard, right?

[@40:46](#) - **Sahil Sharma**

For instance, if you have different flags, your system, your school is not performing in one aspect, then you should be able to be easily able to see that, right?

Like instead of having just a chat bot, you should also have a A dashboard in which you can easily visually see in which aspects you're lacking and in which aspects you're actually making good progress.

So it will be historical as well. So that will be much more visual approach even for the stakeholders.

[@41:14](#) - **Riza Kaya (Unverified)**

It would be, but I'm just technically thinking how much work that are we trying to complicate things too much.

Okay. I think ultimately you're on the ground, you're speaking to the clients, right? And you know what they want exactly.

So we can tailor it as per your request and slow this down. They know what they need from the system.

They know what to ask. They know how to prompt. We just showed them a little bit of the prompts and they just should speak in natural language and prompt what they want for that time.

Because, you know, dashboards look lovely. It's nice. But we're not selling the dashboards. We're selling the tool to get their school into the right.

And every school would have a different importance to what dashboard is important to them and what's not. Yeah.

[@42:07](#) - **Ajay Chakrobarty**

One question, like it would be a per user, let's suppose as a user I have uploaded the document and ask for something.

And another user, you could upload the documents and then in my system I could see only my details, whatever I have asked till now.

Is it something like that or we will have a centralized system where you can ask, I can ask, and everyone can see everyone's details?

Well, you would have your own profile.

[@42:36](#) - **Riza Kaya (Unverified)**

So whatever your history of the chat should stay with you as your person. But the resource data we should be able to control because later on we're going to bring it into the classroom.

So we can say no students in this group, every student in this group should not access this, should not access this.

So it should have that security framework behind it. But initially for this use case. Yeah. There's only a small number of users here, so they should see the main core.

I think we're overlapping here, Ajay. We're going to the second use case.

[@43:09](#) - **Suhail Ahmed (MSBC Group)**

No, no, no. I was asking for the first use case.

[@43:12](#) - **Ajay Chakrobarty**

that, why I'm asking, because I am doing, as a user, I am doing the inspection for one skill, right?

So I have already done that. Then why another user needs to do the same thing? So maybe somehow we could showcase the details, whatever I have already asked.

So it could be the deputy head or the head of the school started something, and they're all looking at the same data.

[@43:37](#) - **Riza Kaya (Unverified)**

So the resources shared absolutely for use case one, because they're all trying to get to the same outcome. Exactly, exactly.

[@43:44](#) - **Ajay Chakrobarty**

That is the thing I'm asking.

[@43:46](#) - **Riza Kaya (Unverified)**

So Ajay, because each person might have different questions, right?

[@43:50](#) - **Suhail Ahmed (MSBC Group)**

Maybe as a deputy, I'd have a different question than a principal. Although the source of truth is the same, each person will still need their own individual profile with their person.

[@44:04](#) - **Riza Kaya (Unverified)**

And also later we can do the security much easier into groups. That individual belongs to that group and then suddenly we can, oh, you can also have access to the teaching resources.

Oh, you can also have to the classroom because one teacher may have multiple rules in the school. That's true.

[@44:21](#) - **Suhail Ahmed (MSBC Group)**

All right. Just for everybody's information, I'm going to share. The team's already reviewed this, but I'll share it nonetheless.

So this is the KHTA summary report that I've opened up for Dubai British School. So a couple of different data points.

I mean, all of these will get from the initial one-time configuration, after which we can just fetch these data points incrementally over a year.

Number of students will increase. All of these will increase. And the main thing, the score would come over here, all these purple, green, yellow rectangles, right?

And what we now need to do, Reza, is... . Define clearly what the data points would be for each of these individual units.

What would we require from the school? That's it. How we compute it? We'll refer to the handbook and the KHDA's framework.

[@45:13](#) - **Riza Kaya (Unverified)**

So I think once you look at the – is this a school's output? Yes, it is. So we're just going to map this to the framework of the KHDA.

So the KHDA framework, and then there's a handbook as well from KHDA. And we just need to map all those points measured within the school's handbook framework here.

Right. Okay. Yeah? Everything is in here. We can't make those up. The school can't make those points up. They don't know what those points are.

Yeah, all comes up. From here, all of the all of the quantitative and all the measurements are all within here and all the schools follow these guides or try to do anyway.

All right.

[@46:14](#) - **Suhail Ahmed (MSBC Group)**

So what we'll do is we'll go through each of these and we will give you recommendations on what we think should be the required data inputs from the school.

From there, you can further ramify them if required.

[@46:27](#) - **Riza Kaya (Unverified)**

Yeah. At the basic level, it's the previous reports and the framework, and then every school will have their own curriculum that they've designed for their own school.

And then whatever you see from here, you know, like these attainment progress, this information will probably come in from the MIS system.

Or if we can't plug into the MIS system, how do we get that information in there? Right. You know, there could be an export that we can do from the school management system, that one-time export or once.

Thanks. Every week, we would just need to work that out, how that looks.

[@47:04](#) - **Suhail Ahmed (MSBC Group)**

Yeah, or even if we can have a one-size-fits-all solution, right, we could, for every new school we onboard, maybe we spend two weeks developing an algorithm that basically maps the data structure they have in the way they have it into our system that just runs.

So we spend that initial two weeks of turnaround time, which serves us in the long run, right, rather than fitting everything into the application.

[@47:30](#) - **Riza Kaya (Unverified)**

Exactly, exactly, because it's so, even if it's the same IB curriculum, every school does it differently, even within the same group of schools, they do it differently.

Correct, correct.

[@47:42](#) - **Suhail Ahmed (MSBC Group)**

Within GEMS itself, right, there are so many different standards and practices.

[@47:46](#) - **Riza Kaya (Unverified)**

Exactly, exactly, every school, kind of the academic side is not controlled by the groups. Correct.

[@47:55](#) - **Suhail Ahmed (MSBC Group)**

One question, like, yeah, yes, sorry, Suhail, let's suppose we...

[@48:00](#) - **Ajay Chakrobarty**

I've already configured the format. Okay, these are the four items to be there in the output. Now, as a user, can I ask the system to add additional line item, let's suppose the comparison chart, so that the system will provide that in the output, or I can't if I already configured the format of the output?

I think it just depends on the LLM model we're using, right?

[@48:28](#) - **Riza Kaya (Unverified)**

The and the capabilities of it.

[@48:31](#) - **Suhail Ahmed (MSBC Group)**

True, but we also, it would be important to define a format, Riza, to avoid hallucinations.

[@48:37](#) - **Ajay Chakrobarty**

Exactly. Is it like, as a user, can I ask, or once configured, then that's I think what we can do is, part of the onboarding, this could be some of the things that we need to look at, because every school would be different.

[@48:51](#) - **Riza Kaya (Unverified)**

Could be. What we could do is, we could have a base template, right? Yes. is happy with it, great, take it.

[@48:57](#) - **Ajay Chakrobarty**

This is what you use, do you want to change it? Then you let.

[@49:00](#) - **Riza Kaya (Unverified)**

Let know and then we'll change it in that two week or one week. And the template would be the HDA template or do you want something different?

[@49:10](#) - **Suhail Ahmed (MSBC Group)**

Let me try and get exactly what they're using internally.

[@49:14](#) - **Riza Kaya (Unverified)**

Is it an Excel sheet they're using internally? Is it a PDF they're using? Is it a Word document that they're using internally?

Let me, because it's very hard to get to this, but I have contacts. Let me try and get to the internal school itself and find out what they're doing internally in the team to prepare for this.

[@49:33](#) - **Ajay Chakrobarty**

Because it really is an internal document.

[@49:35](#) - **Riza Kaya (Unverified)**

It's not being shared with anyone. That document you see in the school is produced by the KHDA. Correct. It's not a school produced document.

[@49:45](#) - **Suhail Ahmed (MSBC Group)**

Yeah, so that would be helpful to know what exactly they're looking for, right? And if you have, let's say, four or five contacts spread across four or five schools, that could serve as their initial market research.

[@49:59](#) - **Riza Kaya (Unverified)**

much. I'm KBS Yeah, yeah, I'll get that into KHD.

[@50:03](#) - **Ajay Chakrobarty**

From the UI perspective. Great, great, great. Yeah, from the UI perspective, is it like the same end of something, ChatGPT or anything else, right?

Yeah, yeah, simple. Keep it very simple.

[@50:20](#) - **Riza Kaya (Unverified)**

Just somewhere on the left would be your histories, and here would be your thing.

[@50:27](#) - **Ajay Chakrobarty**

I mean, I played around with open web UI.

[@50:29](#) - **Riza Kaya (Unverified)**

UI is like open source, offline AI tool. I quite like that, but that's an overkill. And then I built my own HTML and Python one.

That was too simple. Okay.

[@50:47](#) - **Ajay Chakrobarty**

We need to have those additional features, like I could highlight or I could select the text, and then system could read that.

to have that. We I don't think for version one, we should complicate things.

[@51:10](#) - **Riza Kaya (Unverified)**

mean, the most important thing is the rag system should be spot on. The chunking should be, because I've had, this is the problems I've had, is the chunking size, the continuity, images, you know, that content is the most important part for us and the data points.

The visuals, can all, of course, always develop and put that on our roadmap. But at the minimum, it should have a super user side where it can control who comes in, like an admin panel, and then one for the users using it, a history of what put in, and maybe a button to speak, just to, so they don't want to type, they could speak, upload image, upload PDF, upload, you know, some of the different variables.

We're not reinventing the wheel. And also, and another good thing with When it brings, when it answers back to the user with the information, it should recite the source.

Okay.

[@52:11](#) - **Suhail Ahmed (MSBC Group)**

Understood. Now the upload image and upload PDF, could you give us some examples of what the question for that would look like?

[@52:24](#) - **Riza Kaya (Unverified)**

Image I can't think of right now. Right, because these are things apart from the knowledge, the vector itself you're referring to, right?

This is like an add-on for the... Correct. Yeah. But it should also store in the vector as it's been added on.

So, you know, it's another... Now, temporarily stored or will this be permanently cached? I think permanently cached is fine.

Yeah. Okay. Do you have something... It'd be just something like a PDF document, just like the KHDA report. They could have their own one that that was given by...

One of the senior leadership team, or it could be their internal tools that they're using for measuring and getting ready for inspection.

I don't know what that looks like because that's an internal school thing that they can upload. This is what we're using.

Can you see the weaknesses? Does it match what we're doing? Those kind of things. Okay, understood. Yeah.

[@53:23](#) - **Sahil Sharma**

Related to images, in the document that you've shared, inspection guide prompts and responses, we mentioned that there will be evidence of improvements over time and dated work samples showing development.

So that includes the samples that we're talking about here, our image, right? Images of students' work as over time.

And I think he means like the report itself, right?

[@53:49](#) - **Suhail Ahmed (MSBC Group)**

The scores, the grades, etc. The The school reports.

[@53:54](#) - **Sahil Sharma**

Okay, not the work, homeworks, and other things, right? Not the students' We are only talking about the inspection reports in the moment.

[@54:07](#) - **Riza Kaya (Unverified)**

Use case two is a little bit more involved and a lot more actors happening, but some of the data is like the curriculum data is shared.

Yeah. Okay.

[@54:23](#) - **Suhail Ahmed (MSBC Group)**

And so one thing we need to, just a general pointer, we need to be careful of while caching these add-on inputs such as PDF files would be storing it in a different vector store.

The reason being one use case I see a school potentially do is that they receive the KHD inspection report, right?

Let's say they've gotten satisfactory. They've uploaded that along with the report our tool has generated and said, this is the report I received from KHTA.

What are the lapses in my school and how do I improve? That's a one-time reference. And in future chats, unless they're sending follow-up questions within the same thread, it should no longer reference or index that optional added-on PDF document.

Yes. That will be a separate entity, which would mean we would have a separate allocation of storage within our device for these additional data.

Okay. when it nears capacity, we will inhibit them from uploading unless we've upgraded their hardware. Yep. Okay.

[@55:34](#) - **Riza Kaya (Unverified)**

Yeah. Just to make sure we don't overload the system. Again, it's at this point where my knowledge is finished.

I played around with it, but that kind of was like, oh God, yes, this RAC system is very complicated and I'm not gonna reinvent the wheel.

Yeah. mean, fair enough. Right.

[@55:56](#) - **Suhail Ahmed (MSBC Group)**

Within the RAC itself, there are a lot of risks and mitigations. We need to consider, so it's good to have all of these aligned with you on here.

[@56:04](#) - **Riza Kaya (Unverified)**

Yeah, yeah. All right, okay.

[@56:07](#) - **Suhail Ahmed (MSBC Group)**

Now, prior to officially launching it, we will, of course, have a beta release, so just to get the feedback and maybe further refine the document structure, the quality of responses, etc.

But I don't see that being a major point. Right. Now, do you want the report to specifically reference certain samples?

For example, let's say the special needs division within the school, right, and you are referencing work samples of a kid from the special needs class over the period of a year.

And is that something you'd be interested in seeing within the report, saying that, okay, this is evidence of how the student has improved over the period of one year within the special needs department, Arabic, Islamic, etc.?

Thank you.

[@57:01](#) - Riza Kaya (Unverified)

Yeah, and then it goes, this is now kind of touching the use case too, because that's what the teachers would ask.

No, because this is still within KHDA's framework, right? Yes. So, yeah.

[@57:14](#) - Suhail Ahmed (MSBC Group)

There is overlap for sure in terms of data, but it all comes down to how you present it and how you process that data.

ACTION ITEM: Summarize questions & open items from meeting, send coherent document to Riza - [WATCH](#)

Yeah, I don't know the answer to that.

ACTION ITEM: Connect designers with Riza to start mapping out UI/UX design - [WATCH](#)

[@57:24](#) - Riza Kaya (Unverified)

That's completely fine. That's okay.

[@57:26](#) - Suhail Ahmed (MSBC Group)

So what we'll do is, we'll summarize all the questions and open items we have in this goal, and we'll communicate that over to you.

Maybe parallelly, Ajay, what would be good is if we get the designers in touch with Riza, so they can start mapping out how the design would look like, so that he sees the vision start coming to life.

And as we have something visual in front of us, we'll drive this conversation further. But we will require some time to first do our due diligence, come up with a document, and make sure we send something coherent over to you.

[@58:05](#) - **Ajay Chakrobarty**

Yes, you have shared the use case 2 document. Do you have any document for the other use cases?

[@58:16](#) - **Riza Kaya (Unverified)**

I think I shared it for use case 2, the data flow for use case 2.

[@58:21](#) - **Ajay Chakrobarty**

Yes, yes.

[@58:22](#) - **Riza Kaya (Unverified)**

But I created a use case UML diagram for that. I might have done, I'm not sure. I can't remember now.

[@58:34](#) - **Ajay Chakrobarty**

And do we need to restrict the user to upload the document at a certain size, let's suppose 1GB, 2GB, or something like that?

Because you have mentioned the estimated size would be 5 to 20 GB. That's to the main rag system.

[@58:54](#) - **Riza Kaya (Unverified)**

Not to the individual output.

[@58:56](#) - **Ajay Chakrobarty**

think we should limit the individual upload. Exactly.

[@59:00](#) - **Riza Kaya (Unverified)**

I'm not sure what the standard is at the moment, but whatever it is.

[@59:06](#) - **Ajay Chakrobarty**

Because that will directly impact the system.

[@59:10](#) - **Riza Kaya (Unverified)**

Yeah, and we could maybe just restrict that down to a couple of megabytes and then do it that way.

But yeah, all of those are very, very rough. And they may be wrong, those figures, 5, 10 gigs. Those are just kind of numbers, very estimated numbers.

And one more thing.

[@59:35](#) - **Ajay Chakrobarty**

Sorry, just on this, Ajay, sorry.

[@59:37](#) - **Suhail Ahmed (MSBC Group)**

This is an important point as well. So typically in multi-tenancy solutions, Riza, such as Quad or ChatGPT, because they have virtual memory, they don't need to inhibit users from uploading X number of documents, right?

I think your configuration would come down to your pricing models. So if you say I'm comfortable with spending X amount of dollars per school set,

We will first give you the preliminary cost for the hardware. Based on that, will give you an extra cost saying that every additional 10 gigs of data will set you back by X amount of dollars.

Based on that, you can decide what your packages are or if you want to tailor something personally for the school.

[@1:00:16](#) - **Riza Kaya (Unverified)**

We can look at, yeah, absolutely. As part of the hardware offering, we could have different, again, it's the same thing we want with the use cases.

The more functionality they have, obviously the more data we're going to, we'd have a base hardware specification, and then we'd have another one for the number of users.

Of course, the memory goes up from there. Again, that model we're still working on, the business model on subscription modeling, know, how many users can use it and concurrently because we need to restrict that.

We can't just give them a small box with, I don't know, it running after two concurrent users and it slows down.

can't say, here we go, all the school log in and they'll... We were like, this is rubbish. We have to tell them, this system is for one to five concurrent users.

Just be aware. Next model up, because the hardware changes, size changes. Now, five to 20 users. We need to, we will restrict the number of people accessing it, which will restrict the amount of computation it does.

Understood.

[@1:01:24](#) - **Suhail Ahmed (MSBC Group)**

So while we, we'll first come up with a base package, which is below this, we can't do, right? Maybe that could be one to five concurrent users.

[@1:01:34](#) - **Riza Kaya (Unverified)**

Yes, exactly.

[@1:01:35](#) - **Suhail Ahmed (MSBC Group)**

from there, we'll keep it modular, saying that every extra eight gigs of GPU VRAM is X amount of dollars.

Every gigabytes of storage is X amount of dollars. Yes. We'll take it from there.

[@1:01:45](#) - **Riza Kaya (Unverified)**

Yes, I think that's the best way, because technically we know what that can, and how many users it may mean.

But at the, exactly one to five users is the first target. And then from then on, we build on, depending on the hardware we're using, you know.

Again, that's another thing. There's so many different, is it the GPU or is it the, a lot of people are now doing is taking the visual GPU out of it and just converting it just for the AI processing, those same chips.

There's so much technology, it's moving so quickly, I can't keep up with it.

[@1:02:18](#) - **Suhail Ahmed (MSBC Group)**

There are these new NPUs and TPUs as well, which is neural processing units and tensile processing units.

[@1:02:24](#) - Riza Kaya (Unverified)

So there's an Indian company, I think, that does that at the moment. It uses your old graphics card, Radion or whatever you have, dismembers it and then brings those chips together so only your chips are processing for AI, not for graphics.

[@1:02:44](#) - Suhail Ahmed (MSBC Group)

Yeah, and NVIDIA has got some stop line up to the Blackwell digits, etc. But yeah, we'll explore all of these different possibilities and I think next steps would be just to summarize this call, prepare the next items, get that.

ACTION ITEM: Prepare use case 2 scenarios & sample data - [WATCH](#)

Over to you and get the designers to start coordinating with these, to start mapping these things out. Perfect.

[@1:03:06](#) - Ajay Chakrobarty

Okay. Perfect.

ACTION ITEM: Prepare & send agenda w/ questions to Riza in advance of next workshop - [WATCH](#)

[@1:03:07](#) - Riza Kaya (Unverified)

And I'll start preparing the use case to scenarios and some sample data for that as well. Yeah.

[@1:03:16](#) - **Suhail Ahmed (MSBC Group)**

And we want to commit a time right now as to when the next workshop would be. So we'll take a couple of days and send you this document.

And what we'll do, Riza, is before your next, before the next workshop, we'll send you our questions in advance.

So you have an agenda of what we're going to discuss.

[@1:03:34](#) - **Riza Kaya (Unverified)**

Perfect. Perfect. That works well. And before we wrap up, one clarification.

[@1:03:40](#) - **Ajay Chakrobarty**

As the use case one is all about the school inspection. So is it like at the left hand side where the system will showcase all my history?

It will showcase the school name? Yes.

[@1:03:52](#) - **Riza Kaya (Unverified)**

We should be able to customize it very simply. Maybe just a logo. Yes.

[@1:03:59](#) - **Ajay Chakrobarty**

Something. And do we need to have an option where the system could produce the next output based on the duration?

Let's suppose we have done quarter one. Then once quarter two is coming, like has come, then the system could ask a message.

Do you want to produce the quarter two result? Click yes, the system will provide you the response. Let's put that on the roadmap.

[@1:04:27](#) - **Riza Kaya (Unverified)**

I just want to get to market quickly because there's going to be someone in who's going to fill in that role quickly.

We need to just, you know, we know what we're doing, but absolutely that's something we put on the roadmap and we share it on our website.

And then we'll plan that out in six months, eight months time.

[@1:04:46](#) - **Ajay Chakrobarty**

We'd roll that out as a feature. Yeah, ultimately that's going to be, especially with the target making it a mandate, right?

This will be a long-term play.

[@1:04:57](#) - **Suhail Ahmed (MSBC Group)**

Exactly.

[@1:04:57](#) - **Riza Kaya (Unverified)**

For us, it's a long-term. So, I mean, let's... let's... I let's... Get in there. We've got a bit of time now with KHD pausing inspection this year.

[@1:05:04](#) - **Ajay Chakrobarty**

We need to get in there.

[@1:05:06](#) - Riza Kaya (Unverified)

Someone's going to get in there otherwise, you know, there's this IAI companies who probably does it better than they've done it many years and they're only doing this.

They probably can do it, but they don't know the inside knowledge of what we're doing. It's a very niche market.

It's the know-how that they don't have. Right.

ACTION ITEM: Get internal school documents (Excel/PDF/Word) used to prepare for KHDA inspections from contacts at 4-5 schools - [WATCH](#)

[@1:05:24](#) - Suhail Ahmed (MSBC Group)

Yeah. Okay, great. Any further questions? Ajay, Sahil? No, no.

[@1:05:32](#) - Ajay Chakrobarty

Riza, anything from your end?

[@1:05:34](#) - Suhail Ahmed (MSBC Group)

No, I think that's it. then, yeah, we'll just look forward to the next meeting and the questions.

[@1:05:38](#) - Riza Kaya (Unverified)

And then I'll start trying to get some information for you guys as well, for the internal tools that they use in schools.

Brilliant. All right. All right, everyone.

[@1:05:50](#) - **Suhail Ahmed (MSBC Group)**

Thank you for your time. Riza, I'll make sure the documents are sent over to you.

[@1:05:55](#) - **Riza Kaya (Unverified)**

Thank you, guys. Thanks for your time. Appreciate it.

[@1:05:58](#) - **Ajay Chakrobarty**

Bye. Have a good day. Have a good afternoon. Bye-bye.
